

all actions are received for delegation here

The controller is in charge of delegating all actions being asked of it. This also means querying the repository to populate data for the view.

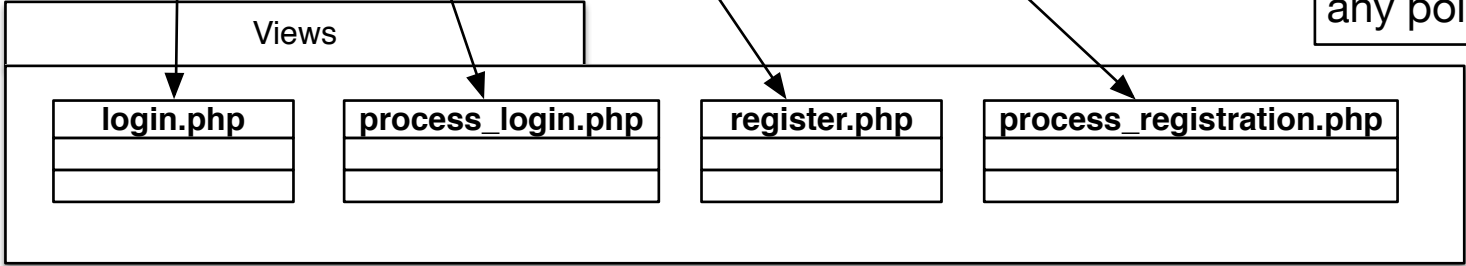

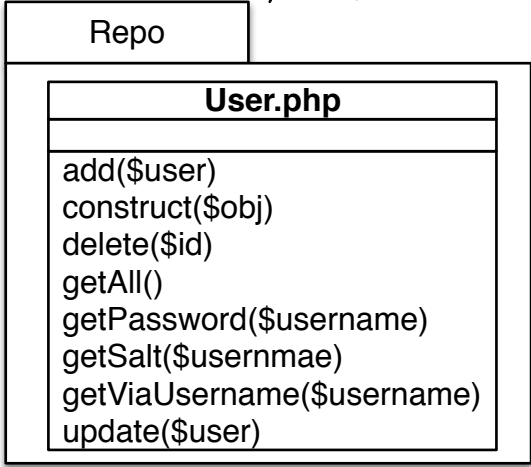

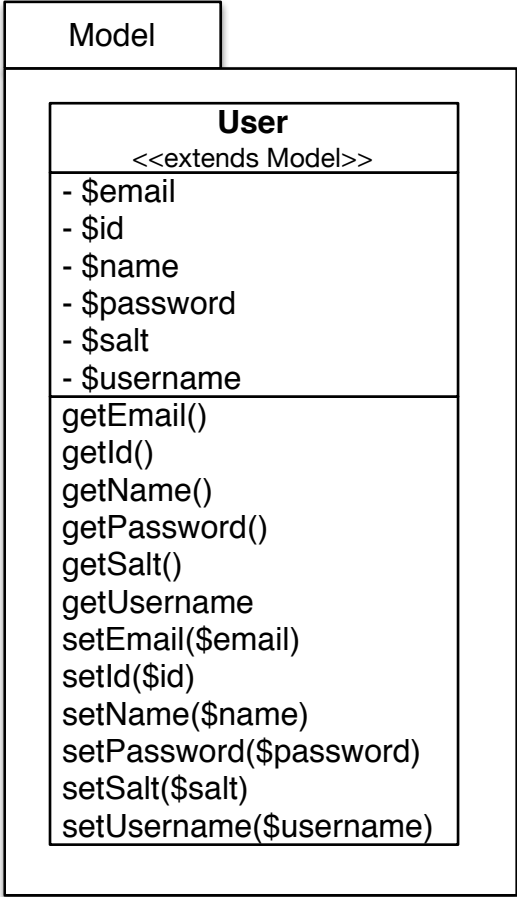

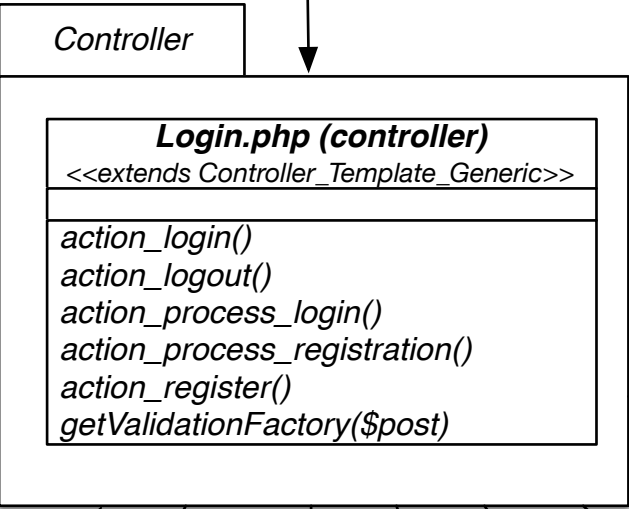

Most of the code for the functionality of these actions appears here in the controller. The only reason for this is because most of the actions involve intercting with the database.

The Model gets used to create a user object (object oriented proگرامing) that can be passed around (instead of passing around raw tables of data).

All names in italics that appear on lines are the actions that you need to type so that the Kohana framework knows where to look for that particular file.

The names used for actions have to be the same as what gets used in the controller's "action_....()" function calls.

\$this->redirect(<insert action here>) can be used at any point in your PHP code.
